

## What is SkyPy?

Skype allows users to edit the last sent message. Though you would know that your chat partner has edited the message, you have no clue about what has the previous value. So SkyPy (**S**kype+**sPy**) keeps track of all such modifications by any of your chat partners provided you run **Skype** and you run **SkyPy** in the background.

It displays the message modification continuously in the terminal. Alongside, it stores all the unedited message history in a separate table which can be accessed even when Skype is not running.

**SkyPy** in simple word is a “*Skype Edited History tracker*”.

## Usage:

- **Install**

To install **SkyPy** run the below command.

```
sh install.sh YOUR.SKYPENAME
```

This command will create the necessary database, tables and create necessary changes so run SkyPy.

- **Run**

Below command will keep track of all edited history by Skype and prints it in the terminal.

```
sh run.sh
```

- **Clean**

If the messages being displayed are too much, they clean it by using below command.

```
sh clean.sh
```

This will take the backup of SkyPy database and clear the tables.
